

Before You start
Open Jupyter
Monitor data drift for a dataset
Clean-up

Monitor Data Drift

Changing trends in data over time can reduce the accuracy of the predictions made by a model. Monitoring for this *data drift* and retraining as necessary is an important way to ensure your machine learning solution continues to predict accurately.

Before You start

If you have not already done so, complete the [Create an Azure Machine Learning Workspace](#) exercise to create an Azure Machine Learning workspace and compute instance, and clone the notebooks required for this exercise.

Open Jupyter

While you can use the **Notebooks** page in Azure Machine Learning studio to run notebooks, it's often more productive to use a more fully-featured notebook development environment like *Jupyter*.

1. In [Azure Machine Learning studio](#), view the **Compute** page for your workspace; and on the **Compute Instances** tab, start your compute instance if it is not already running.
2. When the compute instance is running, click the **Jupyter** link to open the Jupyter home page in a new browser tab.

Monitor data drift for a dataset

In this exercise, the code to monitor data drift is provided in a notebook.

1. In the Jupyter home page, browse to the `/users/your-user-name/mslearn-dp100` folder where you cloned the notebook repository, and open the **Monitor Data Drift** notebook.
2. Then read the notes in the notebook, running each code cell in turn.
3. When you have finished running the code in the notebook, on the **File** menu, click **Close and Halt** to close it and shut down its Python kernel. Then close all Jupyter browser tabs.

Clean-up

If you're finished working with Azure Machine Learning for now, in Azure Machine Learning studio, on the **Compute** page, on the **Compute Instances** tab, select your compute instance and click **Stop** to shut it down.

 **Note:** Stopping your compute ensures your subscription won't be charged for compute resources. You will however be charged a small amount for data storage as long as the Azure Machine Learning workspace exists in your subscription. If you have finished exploring Azure Machine Learning, you can delete the Azure Machine Learning workspace and associated resources. However, if you plan to complete any other labs in this series, you will need to repeat the [Create an Azure Machine Learning Workspace](#) exercise to create the workspace and prepare the environment first.
